Dear Hiring Manager,

I am a Data & AI Automation Engineer who builds the systems that make data work itself. At Nanoninth (Ontel) I was hired as a Data Analyst and, in practice, built the data platform solo: roughly 14 automated ETL pipelines feeding a 111-table warehouse of about 12.2 million rows, replacing a manual pull-and-clean routine that used to span APIs, drives, spreadsheets, and email. On top of that warehouse I shipped production AI tools, including DARA, a natural-language reporting assistant built on Claude and MCP, and Pipeline Guardian, an agent that monitors the pipelines, fixes the safe failures automatically inside a strict schema allowlist, and emails me for approval on the rest.

What I care about is impact that holds up after I walk away. When the accounting team was hand-checking quotes one at a time, I built them a tool that reviews the queue, generates the PDFs in batch, and drafts the emails, with live presence so two people never duplicate the same quote; their output went from 20 to 30 a day to 100 to 200 plus. The same instinct runs through the roles before it: automating quality reporting at Citizen Finedevice for 87.5% less reporting time, a Lean Six Sigma defect cut, and the company's Top Management's Choice Award, then replacing a manual Excel forecast at Emerson (Copeland) with a live Power BI dashboard. Find the manual, error-prone step and make it run on its own.

My background is in Industrial Engineering, which is probably why I reach for process before tooling. I am also working toward the Claude Certified Architect credential so the AI systems I build are not just useful but safe and well-architected. I would welcome the chance to bring this to your team. A fuller picture of my work, with architecture diagrams and code, lives at jamil-mendez.vercel.app, and I would be glad to walk you through any of it.

Thank you for your time and consideration.

Sincerely,

Jamil Mendez
